

A set of competition tasks for the SYSTEMS MANAGEMENT discipline
NETWORK for use in the Professional Skills Competition
NETWORK SYSTEM MANAGEMENT, organized as part of the project
"SkillsComp: Skills competitions as an opportunity to develop vocational education
and training" in Warsaw on March 21-22, 2024

Prepared by: Dr. Eng. Janusz Korniak

Semi-final task

Design and implementation part

Introduction

The competition task contains a network topology that is not fully designed and configured.

The participant's task is to design and configure the specified network components. The task has a 90-minute time limit, and before that time, the saved simulation file must be uploaded to netacad.com to the "?????????" class on netacad.com, along with a text file. The text file is used to record the design steps.

ISP-A addressing table

Device Name	Interface	IP address	Services
Ethernet	prawy.konkurs.edu	Ethernet	DNS, www
		201.1.10.100/24 201.1.20.200/24 2001:cafe:1:20::200/64	DNS, www
ISP-A	G0/0/0.10	201.1.10.1/24	
	G0/0/0.20	201.1.20.1/24 2001:cafe:1:20::1/64	
	G0/0/2	172.31.12.1/30	
	S0/2/0	172.31.12.5/30	

Tasks to be completed:

Preparing IPv4 addressing

Assumptions:

- There are two networks available:
 - o 201.10.10.0/24 – public for splitting using VLSM
 - o 10.0.0.0/8 – private for convenient management splitting. Use length subnet prefix /24
- The L3 network backbone (Layer 3 connections) are the links between:
 - Headquarters – Branch (private address)
 - o Headquarters – C1 (public addressing)
 - about C1 – C2 (private address)
 - o C2 – GS server (private addressing)
 - o Branch – Od1 (private address)
- The public address space should be divided as follows:
 1. Vlan 10, name: DC-A: 20 hosts
 2. Vlan 20, name: DC-B: 12 hosts
 3. Vlan 30, name: DC-C: 6 hosts
 4. Central – C1: 2 hosts
- The order of assigning subnet addresses (according to the rule from largest to smallest) is as follows:
 - above and maintaining continuity
- The private addressing space should be divided as follows:

- o C1 – C2: first (zero) subnet according to the 10.1.x.0/24 scheme
- o C2 – GS server: second subnet according to the 10.1.x.0/24 scheme
- o Headquarters – Branch: third subnet according to the 10.1.x.0/24 scheme
- o Branch – Od1: fourth subnet according to the 10.1.x.0/24 scheme
- o Network Admin: 10.2.1.0/24
- o Vlan 40, name: Prac0 – subnet according to the scheme 10.3.v.0/24, v- vlan number
- o Vlan 41, name: Prac1 – subnet according to the scheme 10.3.v.0/24, v- vlan number
- o Vlan 42, name: Prac2 – subnet according to the scheme 10.3.v.0/24, v- vlan number
- o Vlan 50, name: Gr1 – subnet according to the scheme 10.4.v.0/24, v- vlan number
- o Vlan 60, name: Gr2 – subnet according to the scheme 10.4.v.0/24, v- vlan number
- o Vlan 70, name: Gr3 – subnet according to the scheme 10.4.v.0/24, v- vlan number

Preparing IPv6 addressing

Assumptions:

- The prefix 2001:bac:a::/48 is available
- Use the fourth hexet to create a subnet according to the following scheme:
 - o Vlan 10, name: DC-A: 2001:bac:a:a::/64
 - o Vlan 20, name: DC-B: 2001:bac:a:b::/64
 - o Vlan 30, name: DC-C: 2001:bac:a:c::/64
 - o Headquarters – C1: 2001:bac:a:1::/64
 - o Network Admin: 2001:bac:a:2::/64

Network backbone configuration

- Turn on C1 and C2
- Configure the IPv4 connection interfaces Central – C1 using the first available address
IPv4 on Central and the second on C1. Subnet according to the addressing plan.
- Configure the IPv6 Central – C1 connection interfaces using interface identifiers 1 on Central and 2 on C1. Subnet according to the addressing plan. Match the link local addresses to the interface ID from the global address.
- Configure the IPv4 connection interfaces Headquarters – Branch using the first available IPv4 address on Headquarters and the second on Branch. Subnet according to the addressing plan.
- Configure the IPv4 connection interfaces Branch – Branch1 using the first available address
IPv4 on Branch and the second on Branch1. Subnet according to the addressing plan.
- Configure Layer 3 Etherchannel 1 between C1 - C2. Use PAgP protocol and mode desirable. Assign the last two addresses from the pool, but the lower one to C1.
- Configure the IPv4 C2 – GS server connection interfaces using the first available one
IPv4 address on C2 and the last one on the GS server. Subnet according to the addressing plan. Include the default gateway.
- Activate configured interfaces

Prac network segment configuration

- Connect SW-C2 to C2 with Gigabit ports on both sides (lowest port numbers available). Configure an 802.1q trunk
- Create three vlans with numbers 40,41,42 and names as in the addressing plan description on both switches
- Divide the fastethernet port range on SW-C2 into three parts and assign them to VLANs accordingly
40,42,42

- Connect hosts to the first ports of the individual vlans: PC3:vlan 40, PC4:vlan 41, PC5:vlan 42.
- Enable inter-VLAN routing on C2. Use the first addresses from the subnet pool for addressing SVI interfaces
- Configure a DHCPv4 server on C2 for the three vlans above. Use the same pool names as the vlan names. Exclude the first 10 addresses from the subnet. Use the DNS server address: 201.1.20.200. Include default gateways. Configure hosts PC3-5 for automatic IPv4 configuration.

Admin Network Segment Configuration

- Connect C1 to SW-C1 using the last available ports. Convert the port on C1 as an L3 (router) port and configure IPv4 and IPv6 using the first addresses in the pool. Ensure consistency of the IPv4 host portion, interface ID for the IPv6 GUA, and IPv6 link-local address.
- Configure stateless DHCPv6 on C1 for the Admin network. Pool name Admin. For the DNS server address, use: 2001:CAFE:1:20::200. Configure hosts for IPv6 autoconfiguration
- Configure PC1 and PC2 with static IPv4 addresses (the next available ones). As the DNS server address use: 201.1.20.200

DC network segment configuration

- Configure vlans on C1 and SW-DC according to the assumptions in the addressing plan.
- Enable routing between VLANs for IPv4 and IPv6. Use the first addresses from individual subnet pools on the created interfaces.
- Configure an 802.1q trunk between C1 and SW-DC
- Assign servers to vlans accordingly: DC-A:vlan10, DC-B:vlan20; DC-C:vlan30
- Configure server IPv4 and IPv6 addresses statically using the second available addresses

Configuring OSPF and IPv4 Default Routing

- On all ospf routers the process ID should be 1
- Configure OSPF on Headquarters and Branch specifying router-id (1.1.1.1 and 1.1.1.2 respectively) and interfaces involved in the process with the ip ospf command. •

Configure OSPF on C1 and C2 using the network commands. Include all networks with their masks and configure passive interfaces where appropriate.

- Configure default routing to ISP-A on Headquarters and Branch using the next-hop IPv4 address. The default route from the Headquarters router should be the primary route and the route from the Branch router should be the backup (use an administrative distance of 115). Advertise the default routes in OSPF

PAT configuration

- Hosts with private IPv4 addressing (10.0.0.0) are to use PAT service when communicating to ISP-A.
- Hosts with public addressing are to communicate bypassing the PAT service
- The PAT service is to run on the Headquarters and Branch routers. The translation is to use the address of the interfaces connecting to ISP-A.
- Use ACL number 1 with one entry.

IPv6 routing configuration

- Configure static routing on Centrala to route IPv6 packets to the network internal. Make static entries separately for each network, indicating IPv6 GUA next-hop router.

- Configure IPv6 default routing on C1 to route packets to external networks through the router Central pointing to the IPv6 GUA of the next hop router.

ACL configuration

- Restrict access to the DC-A server IPv4 subnet from all IPv4 subnets of the network segment Group (10.4.v.0/16) for http and https protocols only. Allow other IPv4 traffic between subnets. Configure an ACL on the Branch router. Use the ACL name: ACL-DC-A
- Only the DC-B server should not be reachable via IPv6 from external networks. Use the ACL name: ACL-DC-B

Network segment configuration Group

- Configure Etherchannel 1 between SW-OD-A and SW-OD-C using LACP and mode active. Configure link as trunk
- Configure the connections between the remaining switches as trunks as well. • Configure VLAN 50 and VLAN 60 on all three switches.
- Enable routing between defined VLANs on Od1. Use the first addresses from the subnet pool for addressing subinterfaces. Subinterface numbers match VLAN numbers
- Assign host PC9 to VLAN 50 and PC10 to VLAN 60.
- Configure hosts with IPv4 addressing. Use secondary addresses from the pool for subnets.
- Change the STP protocol mode on the switches to rapid-pvst. SW-OD-A should be the root bridge for both vlans. Make the appropriate configuration without explicitly specifying the priority.
- Change the management interface on all three switches to VLAN50. Configure IPv4 addresses using the last three addresses from the pool for the SW-OD-A, SW-OD-B, SW-OD-C switch (the last one), respectively.
- Prepare the SW-OD-A switch for remote management using SSH. Domain: konkurs.com, key length 1024, user: admin1 with password cisco1 (password should not be in clear text). Configure all lines.
- Configure OSPF on Od1 using the network commands and interface addresses and masks.

Initial topology

Final topology

Semi-final task

The problem part

Description of the situation

Company employees reported several network issues to a newly hired administrator. The new administrator attempted to resolve the issues, but they were unsuccessful. Furthermore, the IT Director noted that the new administrator's actions had escalated the issues. After determining that the administrator lacked the required competencies, he was fired and the services of an external network administrator were retained. As an employee of this administrator, your task is to identify and resolve the issues based on scant documentation and user reports.

- Document all your actions.
- Demonstrate how to establish topology, configuration status, protocol status, connectivity, and In particular, the source of the problem is crucial for scoring this task.
- After determining the probable cause, propose corrective actions and implement them.
- If they are effective, archive the correct network device configuration using TFTP on the Management server. The configuration file name is the device name and the .cfg extension.

Note: Access network devices from PC3 or Management or Laptop1 via SSH (routers and switches) or HTTP (WR0). The username and password for all devices are **admin** and **cisco** , respectively.

Report 1:

- PC0 has been replaced with a new unit. However, when connected, there is no access to networks.
- Objective: Solve the problem

Report 2:

- IOS update is scheduled on the Left 1 router. Since the Left1 and Left2 routers belong to the group HSRP was not afraid of disabling the Left1 router, assuming that the second router would act as the default gateway.
- After turning off the router, Server0 was unreachable. Left 1 was turned back on with no change.
- Goal: Improve HSRP before retrying to upgrade the Left1 router.

Report 3:

- The administrator cannot connect using ssh to the Left0 router from PC3, he must use the server Management
- Goal: Fix the problem. PC3 is the eleventh management unit and needs to have access to network devices.

Report 4:

- Wireless users (Laptop0 and Laptop1) report that they cannot access other networks.
- Objective: Restore connection

Topology of the problem task
